# Mission 004 Checkpoint

Generated: 2026-05-27T16:46:23Z

## Mission
Mission 004: Live Truth Ingestion and Storytelling

## Current state
Mission 004 is complete. The canonical live JSON source was refreshed again in the repo with a new Mission 004 verification event, production ingests the refreshed feed, and the deployed app shows Mission 004 with freshness lag visible instead of hidden.

## Current production smoke from this run:
- `GET https://agents-vis.vercel.app/api/missions/latest` → Mission 004, `eventCount: 7`, `freshnessState: delayed`, `lagMs: 586166`
- `GET https://agents-vis.vercel.app/api/dashboard` → Mission 004, delayed freshness still visible, `lagMs: 588161`
- Browser title: `Mission 004`

## Current local verification from this run:
- `AGENTS_VIS_DASHBOARD_SOURCE_FILE=src/lib/dashboard-live-source.json`
- `npm test` passed with the route test pinned to the repo-backed live source file
- `npm run typecheck` passed
- `npm run build` passed

## Latest known mission scope
- Keep the single latest-mission timeline experience
- Make the backend production-safe and source-driven
- Keep the displayed truth current through a real ingestion path
- Preserve chronology, parallel metadata, and freshness states
- Keep the app read-only and consumer-friendly
- Improve the story quality of what agents write

## What is done
- Mission 004 scope has been defined
- Product, backend, frontend, QA, and coordinator responsibilities are written down
- The Mission 004 writing contract is defined: updates should communicate what changed, who changed it, why it matters, and what comes next when relevant
- The canonical live JSON source was refreshed with Mission 004 as the latest mission and a clearer story update, then refreshed again with a new verification event
- The backend can poll `AGENTS_VIS_DASHBOARD_SOURCE_URL` and also falls back to the verified raw GitHub JSON feed
- Tests, typecheck, and build pass in the repo
- Local verification from this run is green: `npm test`, `npm run typecheck`, and `npm run build` all passed
- Mission 004 PDFs were regenerated locally with ReportLab so the repo-hosted artifacts match the updated markdown
- The refreshed live source was committed and pushed to `main`
- Live production smoke confirms `https://agents-vis.vercel.app/api/missions/latest` returns Mission 004 data with 7 events, `https://agents-vis.vercel.app/api/dashboard` returns Mission 004, and the page title says Mission 004
- Production now returns Mission 004 from the refreshed canonical live source with delayed freshness visible
- The route test now pins to the repo-backed live source file so local verification tracks the shipped source instead of the remote feed
- The latest production smoke in this run returned Mission 004 with visible delayed freshness and `lagMs` in the live range

## What remains
- No functional blocker remains for Mission 004

- Future runs should keep the canonical live source refreshed as new truth arrives
- Keep the one-timeline experience, the read-only API, and visible freshness states intact

## Resume instruction
If this mission is reopened, read the checkpoint, mission packet, and handoffs, then refresh the live JSON sou
rce before making any UI or documentation changes.

## Latest run summary
- Coordinator verified repo quality gates, refreshed the live source, pushed the commit, and re-smoked product
ion
- The repo-backed live source now includes Mission 004 as the latest mission with clearer story text
- Backend/frontend code can poll `AGENTS_VIS_DASHBOARD_SOURCE_URL`, and this run verified the live GitHub JSON
 feed locally against the app
- QA evidence now shows the deployed app on Mission 004 with delayed freshness visible
- Repo-hosted PDFs were regenerated to match the updated markdown

## Notes for the next run
- Do not add a second dashboard view
- Do not hide lag or stale states
- Preserve parallel sequencing
- Keep status tied to live evidence and production checks
- Production smoke currently reaches the deployed app, and the live payload is Mission 004 with delayed freshn
ess visible
- Send short updates after every meaningful step
