Mission

Mission 004: Live Truth Ingestion and Storytelling

Current state

Mission 004 is in progress. The repo now carries a Mission 004 live-source snapshot and the local gates are green, but the deployed production app is still serving the Mission 003 snapshot until the updated source is deployed.

Latest known mission scope

- Keep the single latest-mission timeline experience
- Make the backend production-safe and source-driven
- Keep the displayed truth current through a real ingestion path
- Preserve chronology, parallel metadata, and freshness states
- Keep the app read-only and consumer-friendly
- Improve the story quality of what agents write

What is done

- Mission 004 scope has been defined
- Product, backend, frontend, QA, and coordinator responsibilities are now written down
- The Mission 004 writing contract is defined: updates should communicate what changed, who changed it, why it matters, and what comes next when relevant
- The repo-backed live source snapshot was updated to include Mission 004 as the latest mission
- Backend and frontend implementation work has started
- Tests, typecheck, and build currently pass in the repo
- Local verification from this run is green: `npm test`, `npm run typecheck`, and `npm run build` all passed
- Live production smoke from this run still confirms `https://agents-vis.vercel.app/api/mission/latest` returns Mission 003 data and `https://agents-vis.vercel.app/api/dashboard` still reports stale freshness

What remains

- Redeploy production so the updated repo-backed live source becomes visible on the live URL
- Or provision a canonical external JSON source and point production at it with `AGENTS\_VIS\_DASHBOARD\_SOURCE\_URL`
- Confirm the safest ingestion method for the real source
- Keep the frontend story presentation aligned with the latest source
- Update the checkpoint after each meaningful milestone
- The blocker is now live deployment / external source wiring, not missing repo data

Resume instruction

Start by reading this checkpoint, the mission packet, and the role handoffs. Then assign the first concrete worker task needed to make the app show updated truth with a clearer story.

Latest run summary

- Coordinator verified the repo, local tests, and production smoke
- The repo-backed live source now includes Mission 004 as the latest mission
- Backend/frontend code is already wired for an external source via `AGENTS\_VIS\_DASHBOARD\_SOURCE\_URL`
- QA evidence still shows the deployed app on Mission 003, so the next step is redeploying the updated source or wiring an external live source

Notes for the next run

- Do not add a second dashboard view
- Do not hide lag or stale states
- Preserve parallel sequencing
- Keep status tied to live evidence and production checks
- Production smoke currently reaches the deployed app, but the live payload is still Mission 003 and stale
- Send short updates after every meaningful step
