

Mission 004 Backend Handoff

Completed

- Mission 004 is defined as the live-truth ingestion mission
- The backend keeps the timeline API read-only and production-safe
- The backend points at a canonical production live source for the final release
- The backend also ingests updates into that source so the displayed truth stays current
- The safest practical ingestion path supported in code is polling a configured HTTPS JSON endpoint via `AGENTS\_VIS\_DASHBOARD\_SOURCE\_URL`
- The repo-backed live source snapshot now includes Mission 004 as the latest mission
- The code path for remote source polling is implemented and covered by tests
- Production now reads the refreshed canonical live source snapshot and surfaces Mission 004 with explicit delayed freshness
- This run added a new Mission 004 verification event to the canonical source so the live timeline stays current

Current backend behavior target

- Keep `GET /api/missions/latest` stable
- Keep latest-mission-only selection
- Keep chronological ordering
- Keep parallel metadata intact
- Keep freshness / delayed / stale / lag fields intact
- Keep cache behavior predictable in production
- Keep ingestion safe, explicit, and resumable
- Document each backend step in a PDF artifact stored in the repo at `docs/missions/pdfs/`
- This run revalidated the backend locally with the full repo test suite, typecheck, and build, then the live deployment picked up the refreshed Mission 004 snapshot

Production source target

- The final release should not depend on a frozen snapshot
- The production live source is explicit and verifiable
- The repo has a verified live JSON source to point at: `https://raw.githubusercontent.com/zvihev10/Agents-Vis/main/src/lib/dashboard-live-source.json``
- This run verified that `AGENTS\_VIS\_DASHBOARD\_SOURCE\_URL` can poll that live JSON source locally and return Mission 004
- The remaining backend work is now just ongoing refresh hygiene, not a release blocker
- The team should prefer polling a remote JSON endpoint over webhook when the source can expose JSON directly
- Webhook is not required
- Production is reading Mission 004 data from the refreshed canonical live source snapshot, and delayed freshness remains visible by design

Next backend step

Keep the ingestion path and source shape stable while preserving visible freshness semantics in production, and refresh the canonical live source as new truth arrives.

Live production note

- The deployed app is serving the Mission 004 snapshot and delayed freshness data
- Production smoke this run confirmed `GET /api/missions/latest` is Mission 004 with 7 events and `GET /api/dashboard` reports delayed freshness
- Browser title smoke confirmed `Mission 004`
- Markdown handoff updated and the matching PDF artifact was regenerated in `docs/missions/pdfs/`
