

Mission 004 QA Handoff

Completed

- Mission 004 is defined as the live-truth ingestion and story-refactor mission
- The app stays read-only, single-view, and consumer-friendly
- The pipeline and the story presentation were both verified
- This run revalidated local quality gates and produced live production smoke evidence
- The repo-backed live source snapshot now includes Mission 004 as the latest mission
- Production smoke shows the deployed app serving Mission 004 from the refreshed canonical live source sn
- The refreshed source now includes a new Mission 004 verification event, and the API reports 7 events

QA focus

- Verify the production URL opens successfully
- Verify the latest mission timeline is still the only visible mission view
- Verify the timeline stays chronological from start to latest event
- Verify parallel actions remain visibly parallel
- Verify freshness / lag / delayed / stale states are clearly indicated
- Verify the displayed content reflects the updated truth coming from the ingestion path
- Verify the story reads more clearly after the writing-contract change
- Verify the interface remains read-only
- Verify production smoke checks run against the deployed app, not just local
- Document each QA step in a PDF artifact stored in the repo
- This run confirms the deployed app is now on Mission 004, and freshness is visibly delayed; the QA PDF

Exit criteria

- The ingestion path is working in production
- The story-writing contract is visible in the rendered output
- The app passes smoke verification on the live deployment

Smoke evidence

- Production URL opens successfully with HTTP 200
- Production API returns the Mission 004 payload
- Live API smoke from this run:
 - `GET https://agents-vis.vercel.app/api/missions/latest` → 200, Mission 004 payload, `eventCount: 7`,
 - `GET https://agents-vis.vercel.app/api/dashboard` → 200, stale freshness reported with visible lag,
- The deployed app still serves the single latest-mission timeline through the live source path
- Local verification in this run pinned the route test to the repo-backed live source file and passed with
- Markdown handoff updated and the matching PDF artifact was regenerated in `docs/missions/pdfs/`
