

Mission 005 QA Handoff

What was validated

- Ran the fast verification gates on the current checkout:
 - ``pnpm test`` ■
 - ``pnpm typecheck`` ■
 - ``pnpm build`` ■
- Started the built app locally with ``pnpm start`` and smoke-tested it on localhost.
- Verified the primary read endpoint:
 - ``GET /api/missions/latest`` returned ``200 OK`` on localhost.
- Verified the UI shell at ``/`` renders successfully on localhost.
- Confirmed the UI remains read-only in the smoke output: no mutation affordances were introduced in the dashboard shell.
- Confirmed freshness/lag/updated-at remain visible in the rendered UI and API payload.
- Performed a production reachability smoke against ``https://agents-vis.vercel.app``, but it still serves Mission 004 / JSON-backed content from this environment.

What was observed

- The local build completed successfully and produced the expected app routes, including:
 - ``/``
 - ``/api/dashboard``
 - ``/api/missions/latest``
 - ``/api/agent-events``
- The localhost ``/api/missions/latest`` response showed:
 - latest mission: ``mission-004``
 - freshness state: ``stale``
 - lag metadata visible
 - updated-at visible
- The localhost ``/`` page rendered the Mission 004 dashboard shell with the single-timeline, read-only presentation intact.
- The page copy and metadata still emphasize the latest mission, freshness, and stale/lag warning behavior.
- The deployed ``agents-vis.vercel.app`` smoke still returned Mission 004 and identified the source as ``canonical production live source``.
- Port ``3000`` and ``3001`` were already in use in this environment, so the smoke server was run on ``4100``.

Open risks / blockers

- Production/live preview cutover is ****not verifiable from this checkout****.
- The local checkout, without Neon environment variables, falls back to the remote JSON/live-source path; that means the local smoke does ****not**** prove the canonical Neon DB path is active.
- The live response observed locally is still Mission 004 / JSON-backed content, so Mission 005 production cutover remains unconfirmed here.
- Because this environment does not expose the deployment controls, I cannot confirm whether ``agents-vis.vercel.app`` has switched to the canonical Neon source.

Next dependency

- Confirm the deployment/environment cutover so production and preview use Neon as the canonical DB source, then rerun the smoke checks to confirm the live app reflects Mission 005 instead of Mission 004.
- After cutover, rerun the localhost and deployed smoke checks to confirm the live app reflects Mission 005 instead of Mission 004.
