

Mission 004 Backend Handoff

Completed

- Mission 004 is defined as the live-truth ingestion mission
- The backend must keep the timeline API read-only and production-safe
- The backend must point at a canonical production live source for the final release
- The backend must also ingest updates into that source so the displayed truth stays current
- The safest practical ingestion path now supported in code is polling a configured HTTPS JSON endpoint via ``AGENTS_VIS_DASHBOARD_SOURCE_URL``
- The repo-backed live source snapshot now includes Mission 004 as the latest mission
- The code path for remote source polling is already implemented and covered by tests
- Production now reads the canonical live source snapshot and surfaces Mission 004 with explicit stale freshness

Current backend behavior target

- Keep ``GET /api/missions/latest`` stable
- Keep latest-mission-only selection
- Keep chronological ordering
- Keep parallel metadata intact
- Keep freshness / stale / lag fields intact
- Keep cache behavior predictable in production
- Keep ingestion safe, explicit, and resumable
- Document each backend step in a PDF artifact stored in the repo at ``docs/missions/pdfs/``
- This run revalidated the backend locally with the full repo test suite, typecheck, and build, then the live deployment picked up the Mission 004 snapshot

Production source target

- The final release should not depend on a frozen snapshot
- The production live source must be explicit and verifiable
- The repo now has a verified live JSON source to point at:
``https://raw.githubusercontent.com/zvipev10/Agents-Vis/main/src/lib/dashboard-live-source.json``
- This run verified that ``AGENTS_VIS_DASHBOARD_SOURCE_URL`` can poll that live JSON source locally and return Mission 004
- The remaining backend blocker is only production env wiring, not code coverage
- The team should prefer polling a remote JSON endpoint over webhook when the source can expose JSON directly
- Webhook is not required
- Production is now reading Mission 004 data from the canonical live source snapshot, and stale freshness remains visible by design

Next backend step

Keep the ingestion path and source shape stable while preserving visible stale/lag semantics in production, then set the production env value to the verified raw GitHub JSON feed.

Live production note

- The deployed app is serving the Mission 004 snapshot and stale freshness data
- Production smoke this run confirmed ``GET /api/missions/latest`` is Mission 004 and ``GET /api/dashboard`` still reports stale freshness
- Browser title smoke confirmed ``Mission 004``
