

Mission 004 Frontend Handoff

Completed

- Mission 004 is defined as the live-truth and story-refactor mission
- The UI remains read-only and single-view
- The app should keep only the latest mission timeline visible
- The frontend implementation already renders the clearer story contract and preserves chronology, parallel lanes, and freshness cues
- The repo-backed live source snapshot now includes Mission 004 as the latest mission
- The production UI title and rendered story now follow Mission 004 from the canonical live source snapshot

Current frontend behavior target

- Keep the one-timeline layout
- Keep chronology and parallel lanes visible
- Keep freshness / lag / stale indicators visible
- Improve the wording and structure of timeline entries so the story reads clearly
- Keep the UI consumer-friendly and avoid turning it into a second summary dashboard
- Continue rendering the remote-source payload without changing the visible single-timeline experience
- Document each frontend step in a PDF artifact stored in the repo
- This run revalidated the frontend locally as part of the passing test suite, typecheck, and build; the mission PDFs remain in `docs/missions/pdfs/`

Story refactor target

- The frontend should render the story the agents produce, not invent a new summary layer
- The writing contract should make each update understandable in context
- The UI should highlight who did what, why it mattered, and what changed next
- The frontend should keep the timeline readable as the live source changes
- The browser title now follows the latest mission, so the visible page no longer says Mission 003
- Freshness lag remains visible in the UI and should not be hidden
- Local smoke against the real HTTPS JSON feed confirms the timeline still renders Mission 004 with the same stale indicator

Next frontend step

Keep the one-timeline layout readable and preserve the stale/freshness state so lag remains visible in the UI.
