

Mission 004 Production QA Checklist

QA goal

Verify that the app shows updated truth through the ingestion path and that the story the agents write is clearer in production.

Production acceptance checks

- [] The production URL opens successfully
- [] The app shows only the latest mission timeline
- [] The timeline is chronological from start to latest event
- [] Every visible event is attributed correctly
- [] Parallel actions remain visibly parallel
- [] Full history is still available and scrollable
- [] Stale / lag / partial data is clearly indicated
- [] The interface remains read-only
- [] No secondary summary dashboard appears
- [] The content reflects the updated truth from the ingestion path
- [] The story is clearer because the agent writing contract was updated

Production smoke checks

- [] The production page loads without manual intervention
- [] The production API returns the expected latest-mission payload
- [] Freshness / lag values match the source state
- [] The deployed UI matches the expected layout and messaging

Release checks

- [] Tests passed before deploy
- [] Production deploy completed successfully
- [] Smoke checks were run against production, not just local
- [] Any remaining issue is documented as a blocker or known issue

Exit criteria

- [] The app is production-ready or the blocker preventing release is explicitly documented
