Mission

Mission 004: Live Truth Ingestion and Storytelling

Current state

Mission 004 is in progress. The repo carries a Mission 004 live-source snapshot, the local gates are green, and the latest main-branch push has reached production. The live API now returns Mission 004 and the browser title says Mission 004. Freshness is still visibly stale, so lag remains explicit.

Latest known mission scope

- Keep the single latest-mission timeline experience
- Make the backend production-safe and source-driven
- Keep the displayed truth current through a real ingestion path
- Preserve chronology, parallel metadata, and freshness states
- Keep the app read-only and consumer-friendly
- Improve the story quality of what agents write

What is done

- Mission 004 scope has been defined
- Product, backend, frontend, QA, and coordinator responsibilities are now written down
- The Mission 004 writing contract is defined: updates should communicate what changed, who changed it, why it matters, and what comes next when relevant
- The repo-backed live source snapshot was updated to include Mission 004 as the latest mission
- Backend and frontend implementation work has started
- Tests, typecheck, and build currently pass in the repo
- Local verification from this run is green: `npm test`, `npm run typecheck`, and `npm run build` all passed
- Mission 004 PDFs were regenerated locally with ReportLab so the repo-hosted artifacts match the updated markdown
- The main branch was pushed with the live-source snapshot and the dynamic title fix
- Live production smoke now confirms `https://agents-vis.vercel.app/api/missions/latest` returns Mission 004 data, `https://agents-vis.vercel.app/api/dashboard` returns Mission 004, and the page title says Mission 004

What remains

- Keep the stale freshness visible instead of hiding lag
- Decide whether the source should get a fresh ingest update or stay on the current lagged snapshot
- Keep the production deployment path and any external live-source wiring documented for the next run

Resume instruction

Start by reading this checkpoint, the mission packet, and the role handoffs. Then assign the first concrete worker task needed to make the app show updated truth with a clearer story.

Latest run summary

- Coordinator verified the repo, local tests, and production smoke
- The repo-backed live source now includes Mission 004 as the latest mission
- Backend/frontend code is already wired for an external source via `AGENTS\_VIS\_DASHBOARD\_SOURCE\_URL`
- QA evidence now shows the deployed app on Mission 004, with stale freshness still visible

Notes for the next run

- Do not add a second dashboard view
- Do not hide lag or stale states
- Preserve parallel sequencing
- Keep status tied to live evidence and production checks
- Production smoke currently reaches the deployed app, and the live payload is Mission 004 with stale freshness visible

- Send short updates after every meaningful step
